## Writing Our first Program.

Printing on console: →

print() function in Python

Syntax: - print()

if you don't pass any arguments, it's okay but you still need to put empty parentheses at the end which tells python to execute the function.

⇒ So print() will produce an invisible newline character which will cause a blank line to appear on your screen.

Printing a message: -

print("Hello world!")  
or print('Hello world!') } in python 3

But in python 2: - print was just a statement not function.

print "Hello world"  
print 'Hello world' } ⇒ in python 2

Exercise: - print("Hello world!")

↳ Syntax error: - unterminated string literal.

or you can also write:-

Both are valid { print('Hello world')  
print("Hello world") } → String in single quotes allowed in Python.
